The Extension Installation File Format

The extension installation file is an XML file (with a name ending in .mxi) that provides information for the Extension Manager to use. In particular, it provides the name of the extension, the version number, the type of extension, information about each file included in the extension, and information about how users can access the extension from an Adobe application.

This document describes the tags used in the installation file. For a list of each tag and its compatible Adobe products, see "Tags and their compatible products" on page 48. After reading about these tags, you can examine the sample installation file in the Extension Manager's Samples folder, or you can make a copy of the blank installation file and fill in values for the attributes.

When you create your extension installation file, give it a filename that is valid on both Windows and Macintosh, is no more than 20 characters long, and contains no spaces.

This article contains the following sections:

- "About careful XML coding" on page 2
- "MXI tags" on page 2
- "MXI tag descriptions" on page 4
- "Extension types" on page 42
- "Tags and their compatible products" on page 48
- "Example MXI file" on page 50

About careful XML coding

XML files have fairly strict syntax requirements. When you're creating or editing an extension installation file, make sure you use correct XML syntax:

- Every attribute value must be enclosed in a single pair of double quotation marks. For example, version = 1.0.0 and version = "1.0.0" are both incorrect syntax; instead, use version = "1.0.0".
- A tag defined as an empty tag (a tag with no contents) must end with />. Do not include any spaces between the slash and the closing angle bracket.
- Each attribute name must be preceded by a space (or other form of white space). In particular,
 if you use more than one attribute in a tag, you must put a space between each attribute's value
 and the next attribute's name.
- XML does not support special characters such as ampersands (&). To include an ampersand
 within a tag, you must use the code & (for instance, to use ampersands in menu items or
 other UI elements).

Encoding characters

In previous releases of the Extension Manager, you had to specify the document encoding type for your documents. Beginning with version 1.6, the Extension Manager uses UTF-8 document encoding by default.

MXI tags

The following table lists the primary tags available in the MXI file, briefly describes each tag, and specifies whether the tag contains child tags. Use this table to get an overview of what tags are available and what functions they perform.

Tag	Description	Contains Child Tags?
macromedia-extension	Main tag for extension installation file.	Yes
author	Name of the extension's author.	No
description	Describes what the extension does.	No
products	Container tag that contains tags specifying an extension's compatibility.	Yes
license-agreement	Allows a third-party developer to include a license agreement that is displayed at installation.	No
ui-access	Specifies the text that will appear in the Extension Manager window when the extension is selected.	No
files	Container tag that contains tags describing the files an extension installs.	Yes
configuration-changes	Container tag for tags that modify the application's configuration. These include menus, shortcuts, server behaviors, and data sources.	Yes
documenttype-changes	Describes changes made to the MMdocumentTypes.xml file.	Yes

Tag	Description	Contains Child Tags?
toolpanel-changes	Marks the beginning of Flash toolpanel changes.	Yes
ftp-extension-map-changes	Specifies a change to the FTPExtensionMap.txt file. This defines whether the file is downloaded or uploaded as an ASCII or binary file from Dreamweaver to an FTP server.	Yes
help-changes	Specifies changes to be made to the help system in general. Not supported in Dreamweaver CS3.	Yes
insertbar-changes	Specifies changes to be made to the insertbar.xml file and add new toolbars files.	Yes
server-behavior-changes	Container tag for changes to menus in the menus.xml file in any of the Dreamweaver MX Configuration/ ServerBehaviors/document_type folders.	Yes
server-format-changes	Container tag for changes to menus in the menus.xml file in any of the Dreamweaver MX Configuration/ ServerFormats/document_type folders	Yes
data-source-changes	Container tag for changes to menus in the menus.xml file in any of the Dreamweaver MX Configuration/DataSources/document_type folders.	Yes
menu-remove	Provides information about a menu bar, menu, menu item, or format to remove during installation of an extension.	No
menu-insert	Specifies where in the product's menus to insert a menu bar, menu, menu item, or format during installation of an extension.	No
menu	Describes a menu or submenu to be inserted into the product's menu structure during installation of an extension.	No
menuitem	Describes the menu item to be inserted into the product's menu structure during installation of an extension.	No
format	Describes the data format to be inserted into the Dreamweaver Format menu during installation of the extension.	No
separator	Specifies that a separator be inserted into a menu at the location indicated by the containing menu-insert tag.	No
comment	Provides a comment about an item being inserted into the menu structure. The Extension Manager inserts this comment (in the form of an XML comment tag) into the menus.xml file as it installs the extension.	No
shortcut-remove	Indicates that the specified keyboard shortcut should be removed from the menus.xml file.	No
shortcut-insert	Indicates that a keyboard shortcut should be added to the menus.xml file.	No

Tag	Description	Contains Child Tags?
shortcut	Specifies a keyboard shortcut to be added to the menus.xml file.	No
taglibrary-changes	Describes changes to be made to the TagLibraries.vtm file.	Yes
toolbar-changes	Inserts the specified tag library at the end of the file.	Yes
extensions-changes	Container tag that describes any changes to the Extensions.txt file, such as adding or removing extensions that you can open in Dreamweaver.	Yes
file-tokens	Container tag that allows you to specify tokens. Tokens let you specify the destination folder of one or more files from your extension during installation or provide a dialog box for the user to choose a destination folder for certain files.	Yes
token	Defines a custom token for an extension. Custom tokens let you specify the destination folder of one or more files from an extension during installation, or provide a dialog box for the user to choose a destination folder.	No

MXI tag descriptions

The tags used in the extension installation file are described below. Attribute names enclosed in curly braces ({--}) are optional. The tags are listed according to their position with the MXI file hierarchy. For example, the macromedia-extension tag is the main tag within the file, and is the first tag described.

macromedia-extension

Description

Main tag for extension installation file.

Attributes

```
id, name, version, type, {requires-restart}
```

id A unique extension ID, to be created by Adobe after you submit your extension. Never add or modify this attribute yourself.

name The name of the extension. This must be a VARCHAR data type with a limit of 255 characters.

version The version number of the extension, in the format $a\{.b\{.c\}\}$, where a, b, and c are all positive integers. For example, valid version numbers include 1, 3.6, and 10.0.1. The first number is the major version number, incremented when you make substantial changes to the extension; the second number is the minor version number, incremented for smaller changes. The third number is incremented for each new "build" of the extension between releases; for example, after you submit version 4.1 of your extension to Adobe, it may be returned to you for minor corrections. You might label the fixed version 4.1.1; after a couple of rounds of corrections, the version number of the posted extension might be 4.1.3.

type Indicates what kind of extension this is.

• Valid values for Dreamweaver are:

behavior, browserprofile, codehint codesnippet, coloringscheme, command, connection, datasource, dictionary, documenttype, encoding, flashbuttonstyle, flashelement, floater, insertbar, jsextension, keyboard shortcut, object, plugin, propertyinspector, report, referencebook, samplecontent, serverbehavior, serverformat, servermodel, site, suite, taglibrary, template, thirdpartytags, toolbar, translator, utility, and query.

Valid values for Fireworks are:

autoshape, command, commandpanel, dictionary, keyboard shortcut, library, pattern, and texture.

• Valid values for Flash are:

actionscript, flashcomponent, flashcustomaction, flashimporter, flashpanel, flashtemplate, generatorobject, keyboardshortcut, lesson, library, publishtemplate, sample, smartclip, and utility.

Extensions of type "generatorobject" are supported only by Flash 5 and earlier. Values are not case-sensitive; "object" is equivalent to "Object".

Note: The value "suite" denotes a set of items that are released as a unit, in a single MXP file, with a single MXI file. For example, you can create a set of objects, a command, a palette, and behaviors to make a process such as layer alignment easier to complete. Specify a single name and version for the entire suite.

requires-restart Indicates whether the Adobe application must be restarted after the extension is installed. Valid values are "true" and "false".

Contents

This tag must contain a description tag, a ui-access tag, a products tag, and an author tag. If you're changing the menus, this tag must also contain a configuration-changes tag. If you're installing files, this tag must also contain a files tag.

Container

None.

Example

```
<macromedia-extension
  name = "FrobSquigger Command"
  version = "1.0.0"
  type = "command"
  requires-restart = "false" >
    <!-- description, ui-access, products, author, configuration-changes, and
  files tags go here -->
</macromedia-extension>
```

Note: The macromedia-extension tag must be located at line 1 of your file.

description

Description

Describes what the extension does or is used for.

Attributes

None.

Contents

This tag must contain a CDATA section, and uses a VARCHAR data type with a limit of 2000 characters. You can use br and to format the CDATA information.

Container

This tag must be contained in a macromedia-extension tag.

Example

```
<description><![CDATA[This command converts a frob into a squig.<br>Be sure not to use it on a grickle!]]></description>
```

license-agreement

Description

This tag lets third-party developers include a license agreement with extensions they develop. The contents of this tag are displayed under the heading Third Party License, at the end of the new extension install license.

If the license-agreement tag is omitted from the MXI file, only the default extension disclaimer is displayed.

Attributes

None.

Contents

This tag must contain a CDATA section, and uses a VARCHAR data type with a limit of 2000 characters. You can use br and to format the CDATA information.

Container

This tag must be contained in the macromedia-extension tag.

Example

cense-agreement><![CDATA[You are about to install an Extension from the
 Adobe Exchange. The Adobe Exchange is an area of the adobe.com website that
 allows third parties to submit extensions for posting to adobe.com.]></
 license agreement>

ui-access

Description

Specifies the text that will appear in the Extension Manager window when the extension is selected. You should include information about where to find the item in the product's user interface as well as a brief description of the item's use.

Attributes

None.

Contents

This tag must contain a CDATA section. You can use br and to format the CDATA information. This is a VARCHAR data type with a limit of 512 characters.

Container

This tag must be contained in a macromedia-extension tag.

Example

```
<ui-access><![CDATA[You can run this command by choosing<br/>&nbsp;&nbsp;&nbsp;Commands > Convert Frob to Squig.]]></ui-access>
```

products

Description

Container tag for product tags.

Attributes

None.

Contents

This tag must contain one or more product tags.

Container

This tag must be contained in a macromedia-extension tag.

```
ducts>
  <!-- product tags go here -->
```

product

Description

Specifies which Adobe product or products your extension is compatible with. List each product in a separate product tag.

Attributes

```
name, {version}, {primary}, {required}
```

name The name of an Adobe product. Valid values are currently "Dreamweaver", "Fireworks", and "Flash". This attribute uses a VARCHAR2 data type with a limit of 64 characters.

version The version number of the specified Adobe product. Valid version numbers are:

Product	Version number
Dreamweaver MX 2004	7
Dreamweaver 8	8
Dreamweaver CS3	9
Fireworks MX 2004	7
Fireworks 8	8
Fireworks CS3	9
Flash MX 2004	7
Flash 8	8
Flash CS3	9

For example, if your extension is for Dreamweaver MX 2004, specify version = "7". The extension can be installed in any version of the product greater than or equal to the specified version number. This attribute uses a VARCHAR data type with a limit of 8 characters.

primary Indicates whether the specified Adobe product is the one the extension was primarily intended to be used with. For example, if the extension's user interface appears in Dreamweaver but the extension also uses Fireworks, Dreamweaver is the primary product. Specifying primary = "true" implies required = "true" as well. Only one product should set the primary attribute to "true". For example, product name = "Dreamweaver" version = "7" primary = "true" /> indicates that this extension is primarily intended for Dreamweaver; however, it might be used in another product that supports the Extension Manager.

required Indicates whether the specified Adobe product is required for the extension to function properly. If the extension will function without the indicated product, even if it won't function as well without it, specify "false" or omit the required attribute. If you don't specify required = "true" for any product tag, the product specified in the first product tag listed is assumed to be required.

```
Contents
```

None.

Container

This tag must be contained in a products tag.

Example

```
duct name = "Dreamweaver" version = "7" primary = "true" />
```

author

Description

Name of the author of the extension.

Attributes

name

name The author's name. This attribute uses a VARCHAR data type with a limit of 255 characters.

Contents

None.

Container

This tag must be contained in a macromedia-extension tag.

Example

```
<author name = "Jambalaya Joe" />
```

files

Description

Container tag for all of the file tags.

Attributes

None.

Contents

This tag must contain one or more file tags.

Container

This tag must be contained in a macromedia-extension tag.

```
<files>
  <!-- file tags go here -->
</files>
```

Description

Provides information about a specific file to be installed as part of the extension.

Note: Use menu-insert tags to explicitly add your item to menus even if your extension is an object or a command; don't rely on the Adobe product to automatically add objects and commands to its menus. See menu-insert for details.

Attributes

source, destination, {platform}, {shared}, {systemfile}, {win-extension}

The name of the file. It can include a path relative to the location of the installation file; the extension's files don't all have to be in the same folder. The filename must be a valid name on both Windows and Macintosh, unless you specify a value for the platform attribute. You can use a colon (:), slash (/), or backslash (\) as the separator between folder names (and before the filename) in the path. Note that in some operating systems, filenames are case-sensitive; make sure to use the same capitalization in the source attribute as you use for the corresponding file and folder names on your disk. Filenames should be a total of 30 characters or less.

Do not use the same filenames as Adobe extensions unless your extension is intended as a substitute for a Adobe extension.

destination The name of the folder the file will be copied to. If the folder doesn't exist, the Extension Manager creates it during installation. Note that this attribute should contain a folder name, not a filename. The filename is specified by the source attribute. The attributes you can use to refer to installation folders are:

Attributes	Description
\$Dreamweaver	Specifies the Dreamweaver installation folder
\$Fireworks	Specifies the Fireworks installation folder
\$Flash	Specifies the Flash installation folder
\$System	Specifies the System or System32 folder
\$Fonts	Specifies the Font folder on the computer's hard disk

The Extension Manager picks the appropriate system and font folder on the user's disk, based on the user's platform and operating system. If none of these options suits your needs, you can define your own custom tokens for the destination of your files. For information about writing custom tokens, see token.

Generally, destination folders should be inside the application's Configuration folder. The destination attribute is not case-sensitive; configuration is the same as Configuration. The folder name must be a valid name on both Windows and Macintosh, unless you specify a value for the platform attribute. You can use a colon (:), slash (/), or backslash (\) as the separator between folder names in the path. Note that in some operating systems, folder names are case-sensitive; make sure to use the correct capitalization for your folder names.

If your extension for Dreamweaver contains multiple files, such as help files, many images, or a suite of items, the destination folder for your files should be a folder in the Configuration/Shared folder. The folder name should be related to your company or product—for example, Configuration/Shared/MagicTricks.

You do not need to include the Configuration folder in the path name for Flash extensions. The folder specified in the destination tag is automatically created in the Configuration folder if it does not already exist.

For a list of valid extension types by application, associated destination strings, and version availability, see "Extension types" on page 42

platform Indicates what platform the file is intended for. If you specify a platform, the file is installed only on that platform; for instance, you can provide two versions of a file, one for Windows and one for Macintosh, and specify a platform value for each. Valid values are "win" and "mac". If you don't specify this attribute, the file is installed on both platforms.

shared Indicates whether the file is used by more than one extension. When you use the Extension Manager to remove an extension, a shared file associated with that extension is not deleted as long as other installed extensions refer to that file. Valid values are "true" and "false". If you don't specify this attribute, its default value is "false".

Note: If you install a newer version of a shared file and another extension is using the old version of the file, the new shared file either must be backward compatible with the other extension, or must have a new filename so that the other extension continues to work properly.

systemfile Indicates whether the file is used by anything other than extensions. For example, some extensions provide new versions of DLLs or other system files, or files that are used by other applications. If a file is specified as systemfile = "true", it is not deleted when the extension is removed, even if no other extensions use the file. When systemfile is set to true, the shared attribute is ignored.

win-extension Used when a file is generated on the Macintosh that does not include the Windows extension, such as .fla or .htm.

For example, a FLY file named "shoo" created on a Macintosh installs with the correct creator and file-type information on another Macintosh. However, in a Windows system, it requires the following to install properly in the Configuration\Shared\Thingies folder:

```
<file source="shoo" destination="$Dreamweaver/configuration/shared/thingies/"
win-extension="fly" />.
```

This adds the extension to the filename and installs "shoo.fly".

If you create a file in Windows that does include the extension, such as "heeble.fla" or "frob.htm", and install it on a Macintosh, the win-extension attribute does not need to be added to the file tag.

Note: If the platform attribute is included, the win-extension attribute is ignored.

Contents

None.

Container

This tag must be contained in a files tag.

```
<file source = "frob2squig.htm" destination = "$Dreamweaver/configuration/
commands/common" platform = "mac" shared = "false" />
```

configuration-changes

Description

Container tag for changes to menus, shortcuts, server behaviors, server formats, and data sources.

Attributes

None.

Contents

This tag may contain any combination of data-source-changes, menu-insert, menu-remove, server-behavior-changes, server-format-changes, server-format-definition-changes, shortcut-insert, and shortcut-remove tags.

Container

This tag must be contained in a macromedia-extension tag.

Example

```
<configuration-changes>
    <!-- ftp-extension-map-changes, menu-remove, menu-insert, shortcut-remove,
    shortcut-insert, server-behavior-changes, server-format-changes, server-
    format-definition-changes, and data-source-changes tags go here -->
</configuration-changes>
```

documenttype-changes

Description

Describes changes to be made to the MMDocumentTypes.xml file.

Attributes

None.

Contents

This tag contains the documenttype-insert and documenttype-remove tags.

Container

This tag must be contained in a configuration-changes tag.

Example

This example illustrates the syntax of the tags that can be contained by the

documenttype-insert

Description

Insert the specified tag library at the end of file.

Attributes

None.

Contents

The documenttype tag describes the document type to be inserted. The Extension Manager verifies only that the XML structure is valid.

Container

This tag must be contained in a documenttype-changes tag.

Example

documenttype-remove

Description

Removes the specified document type.

Attributes

id

id ID of the document type to remove.

Contents

None.

Container

This tag must be contained in a documenttype-changes tag.

```
<documenttype-remove id="remove_id" />
```

toolpanel-changes

Description

Marks the beginning of Flash tool panel changes.

Attributes

None.

Contents

This tag may contain the toolpanel-item-insert tag.

Container

This tag must be contained in a configuration-changes tag.

Example

toolpanel-item-insert

Description

Inserts the tool with the specified name into the Flash tool panel.

Attributes

```
name, position, depth
```

name The name of the tool to insert. This is a required attribute.

position The 0-based position at which to insert the tool. Valid positions are 0 through 17. If the attribute is missing, or has a value beyond 17, the tool assumes the last position in the toolbar by default. This is an optional attribute.

depth The 0-based depth of the tool is its position in the toolbar, where 0 specifies the top. If the depth attribute is missing, or has a value beyond the bottom of the menu as the tool's position, the tool depth defaults to the bottom of the menu. This is an optional attribute.

Contents

None.

Container

This tag must be contained in a toolpanel-changes tag.

ftp-extension-map-changes

Description

Specifies a change to the FTPExtensionMap.txt file located in the Configuration folder.

Attributes

None.

Contents

This tag may contain an ftp-extension-insert tag and an ftp-extension-remove tag.

Container

This tag must be contained in a configuration-changes tag.

Example

```
<ftp-extension-map-changes>
    <!-- ftp-extension-insert, ftp-extension-remove tags go here-->
</ftp-extension-map-changes>
```

ftp-extension-insert

Description

Specifies a change to the FTPExtensionMap.txt file. This defines whether the file is downloaded or uploaded as an ASCII or binary file from Dreamweaver to an FTP server.

Attributes

```
extension, type, mac-creator, mac-file-type extension The file extension, such as .gif or .jpg.
```

type The format used when you upload a file to the FTP server. The current valid values are "ASCII" and "Binary".

```
mac-creator The Macintosh creator code. If you do not know the creator code, use "????".

mac-file-type The Macintosh file type. If you do not know the file type, use "????".
```

Contents

None.

Container

This tag must be contained in an ftp-extension-map-changes tag.

```
<ftp-extension-insert extension="JPG" mac-creator ="MKBY" mac-file-type="JPEG"
type="ASCII"/>
```

ftp-extension-remove

Description

Indicates the extension that is removed from SourceFormat.txt in the Configuration folder.

Attributes

```
extension The file extension, such as .gif or .jpg.
```

Contents

None.

Container

This tag must be contained in an ftp-extension-map-changes tag.

Example

```
<ftp-extension-remove extension="JPG" />
```

help-changes

Description

Describes changes to be made to the help system in general. Currently, Adobe supports only changes to the help books.

This tag is not supported in Dreamweaver CS3.

Attributes

None.

Contents

```
helpbook-changes tag.
```

Container

This tag must be contained in a configuration-changes tag.

Example

This example illustrates the syntax of the tags that can be contained by the help-changes tag.

helpbook-changes

Description

Describes changes to be made to the help books part of the help system.

Attributes

None.

Contents

This tag may contain the helpbook-insert and helpbook-remove tags.

Container

This tag must be contained in a help-changes tag.

Example

helpbook-insert

Description

Inserts the specified help book.

Attributes

None.

Contents

The book-id tag describes the help book to be inserted. The help book is appended to the list of existing books. The Extension Manager verifies only that the XML structure is valid.

Container

This tag must be contained in a helpbook-changes tag.

```
<helpbook-insert>
     <book-id .../>
</helpbook-insert>
```

helpbook-remove

Description

Removes the specified help book.

Attributes

id

id ID of the help book to be removed.

Contents

None.

Container

This tag must be contained in a helpbook-changes tag.

insertbar-changes

Description

Marks the beginning of changes to Insertbar.xml. Note that InsertBar.xml is automatically updated when objects are installed into Dreamweaver MX. Modifying the file explicitly from the MXI file is not required.

Attributes

None.

Contents

The insertbar-insert, insertbar-item-insert, and category tags describe the category to be inserted. The Extension Manager verifies only that the XML structure is valid.

Container

This tag must be contained in a configuration-changes tag.

Example

18

insertbar-insert

Description

Inserts the specified category at the end of file.

Attributes

insertBefore | insertAfter = category_id of the existing category to insert before or after. You can specify only one of the two attributes; either insertBefore or insertAfter.

Contents

The category tag that describes the category to insert. The Extension Manager verifies only that the XML structure is valid.

Container

This tag must be contained in a insertbar-changes tag.

Example

insertbar-remove

Description

Removes the specified category.

Attributes

```
category_id
category_id ID of the category to be removed.
```

Contents

None.

Container

This tag must be contained in the insertbar-changes tag.

```
<insertbar-remove id="category_id" />
```

insertbar-item-insert

Description

Inserts the specified item at the specified location.

Attributes

```
insertBefore | insertAfter, appendTo | prependTo, category
```

insertBefore | insertAfter ID of the existing item before or after which the specified item should be inserted.

 $\label{eq:continuous} \mbox{appendTo} \quad \mbox{ID of the existing category to which the specified item is appended or prepended.}$

category ID of the category to append to if the <code>insertBefore|insertAfter</code> item isn't found.

Contents

A tag that describes the item to insert. The Extension Manager verifies only that the XML structure is valid.

Container

This tag must be contained in the insertbar-changes tag.

Example

```
<insertbar-item-insert
  insertBefore | insertAfter | appendTo | prependTo = category_or_item_id
  category = category_id
  <itemtype.../>
</insertbar-item-insert>
```

insertbar-item-remove

Description

Removes the specified insertbar item.

Attributes

id

id ID of the item to be removed.

Contents

None.

Container

This tag must be contained in a insertbar-changes tag.

```
<insertbar-item-remove id = item_id />
```

server-behavior-changes

Description

Container tag for changes to menus in the ServerBehaviors.xml file in any of the Dreamweaver MX Configuration/ServerBehaviors/servermodel folders.

Attributes

```
servermodelfolder
```

servermodelfolder The name of the server model folder in which the changes are to be made. The name of any installed server model (such as "ASP.NET_Csharp", ASP.NET_VB", "ASP_Js", "ASP_Vbs", "ColdFusion", "UD4-ColdFusion", "PHP_MySQL" or "JSP") is a valid value. Note that the attribute value must precisely match the name of the corresponding server model folder.

Contents

This tag may contain any combination of menu-remove and menu-insert tags.

Container

This tag must be contained in a configuration-changes tag.

Example

```
<server-behavior-changes servermodelfolder = "ASP_VB">
    <!-- menu-remove, menu-insert tags go here -->
</server-behavior-changes>
```

server-format-changes

Description

Container tag for changes to menus in the Formats.xml file in any of the Dreamweaver MX Configuration/ServerFormats/servermodel folders.

Attributes

```
servermodelfolder
```

servermodel folder The name of the server model folder in which the changes are to be made. The name of any installed server model (such as "ASP.NET_Csharp", ASP.NET_VB", "ASP_Js", "ASP_Vbs", "ColdFusion", "UD4-ColdFusion", "PHP_MySQL" or "JSP") is a valid value. Note that the attribute value must precisely match the name of the corresponding server model folder.

Contents

This tag may contain any combination of menu-remove and menu-insert tags.

Container

This tag must be contained in a configuration-changes tag.

```
<server-format-changes servermodelfolder = "ASP_VB">
  <!-- menu-remove, menu-insert tags go here -->
  </server-format-changes>
```

server-format-definition-changes

Description

Container tag for changes to menus in the ServerFormats.xml file in any of the Dreamweaver MX Configuration/ServerFormats/servermodel folders.

Attributes

```
servermodelfolder
```

servermodelfolder The name of the server model folder in which the changes are to be made. The name of any installed server model (such as "ASP.NET_Csharp", ASP.NET_VB", "ASP_Js", "ASP_Vbs", "ColdFusion", "UD4-ColdFusion", "PHP_MySQL" or "JSP") is a valid value. Note that the attribute value must precisely match the name of the corresponding server model folder.

Contents

This tag may contain any combination of menu-remove and menu-insert tags.

Container

This tag must be contained in a configuration-changes tag.

Example

```
<server-format-definition-changes servermodelfolder = "ColdFusion">
    <!-- menu-remove, menu-insert tags go here -->
</server-format-definition-changes>
```

data-source-changes

Description

Container tag for changes to menus in the DataSources.xml file in any of the Dreamweaver MX Configuration/DataSources/servermodel folders.

Attributes

```
servermode1
```

servermodel folder The name of the server model folder in which the changes are to be made. The name of any installed server model (such as "ASP.NET_Csharp", ASP.NET_VB", "ASP_Js", "ASP_Vbs", "ColdFusion", "UD4-ColdFusion", "PHP_MySQL" or "JSP") is a valid value. Note that the attribute value must precisely match the name of the corresponding server model folder.

Contents

This tag may contain any combination of menu-remove and menu-insert tags.

Container

This tag must be contained in a configuration-changes tag.

```
<data-source-changes servermodel = "ASP_VB">
    <!-- menu-remove, menu-insert tags go here -->
</data-source-changes>
```

menu-remove

Description

Provides information about a menu bar, menu, menu item, or format to remove during installation of this extension.

Note: If the user removes an installed extension, the menus, menu items, and formats that were removed when that extension was installed are not restored.

Attributes

id

The menu ID of the item to be removed. Menu bars and menus are not removed unless they're empty. To find the menu ID of an item in a Dreamweaver menu, look for the item in the menus.xml files. (To find the menu ID of a format, look for the item in the Formats.xml files.)

Contents

None.

Container

This tag must be contained in a configuration-changes, server-behavior-changes, server-format-changes, server-format-definition-changes, or data-source-changes tag.

Example

```
<menu-remove id = "DWMenu_Commands_FrobSquigger-beta" />
```

menu-insert

Description

Specifies where in the product's menus to insert a menu bar, menu, menu item, or format during installation of this extension.

Use menu-insert tags to explicitly add your extension to menus even if your extension is an object or a command; don't rely on the Adobe product to automatically add objects and commands to its menus. To ensure that your extension is not automatically added to the menus, add <!-- MENU-LOCATION=NONE --> to the top of each of your extension's HTML files. If you do this, you must make an entry for your file in the menus.xml file.

Attributes

```
insertAfter, insertBefore, appendTo, prependTo, {skipSeparator}
```

You can specify only one of the following four attributes: insertAfter, insertBefore, appendTo, or prependTo.

insertAfter Indicates that the new item should be inserted immediately following the item with the specified ID. (The ID can be the ID of a menu bar, a menu, a menu item, or a format.)

Note: No menu can appear to the right of the Help menu in Dreamweaver. If you insert a new menu after the Help menu, the application displays the new menu to the left of the Help menu.

insertBefore Indicates that the new item should be inserted immediately before the item with the specified ID. (The ID can be the ID of a menu bar, a menu, a menu item, or a format.)

appendTo Indicates that the new item should be inserted immediately after the last item in the specified menu or menu bar. (The specified ID can be the ID of a menu bar or a menu only, not a menu item or format.)

prependTo Indicates that the new item should be inserted before the first item in the specified menu or menu bar. (The specified ID can be the ID of a menu bar or a menu only, not a menu item or format.)

skipSeparator Applies only if the insertAfter attribute is also specified. It indicates that the new item should be inserted after the separator that immediately follows the item specified in insertAfter. If there is no separator there, or if insertAfter is not used, this attribute is ignored. Valid values are "true" and "false"; the default value is "false".

Contents

In most uses, this tag must contain one or more menu tags and/or one or more menuitem tags. (When this tag appears inside a server-format-definition-changes tag, it contains format tags instead of menuitem tags.) It may also optionally contain separator tags and comment tags. Everything inside the menu-insert tag is inserted as a block, retaining its order; for example, if you list four menu items inside a menu-insert tag, those four items are inserted at the specified location so that they appear in the menu structure in the same order.

You can insert as many menus, menu items (or formats), separators, and comments as you want in a single menu-insert tag, but they can't be nested. That is, you can't insert a new menu and its contents by listing the items inside the menu tag. Instead, insert the menu first with one menu-insert tag, then insert all of the items into the new menu using another menu-insert tag. In the example below, the menu item Animals is inserted in the Insert menu after the Get More Objects menu item. The Animals menu item contains the submenus Cat and Dog. The Dog menu contains yet another submenu called Poodle. This is the resulting menu structure:

Container

This tag must be contained in a configuration-changes, server-behavior-changes, server-format-changes, server-format-definition-changes, or data-source-changes tag.

Example

```
<menu-insert insertAfter = "DWMenu_Commands_SortTable" skipSeparator = "true">
    <!-- menu, menuitem (or format), separator, and comment tags here -->
</menu-insert>
```

menubar

Description

Provides information about a menu bar to be inserted into the product's menu structure during installation of this extension.

Attributes

```
name, id, {platform}
```

name The name of the menu bar to insert.

id ID for the new menu bar. Your menu IDs should start with a company name or some other namespace prefix to ensure uniqueness. In particular, don't start your menu IDs with DW, which is the prefix used by Dreamweaver menu IDs.

platform Indicates that the menu bar should appear only on the given platform. Valid values are "win" and "mac".

Contents

None.

Container

This tag must be contained in a menu-insert tag.

```
<menubar name = "Mugwump Context menu" id = "JMMugwumpContext"
platform = "mac"></menubar>
```

menu

Description

Describes a menu or submenu to be inserted into the product's menu structure during installation of an extension.

Attributes

```
name, id, {platform}
```

name The name of the menu to insert, as it will appear in the menu bar. To set the menu's access key (mnemonic) in Windows, use an underscore (_) in front of the access letter. The underscore is automatically removed on the Macintosh.

The menu ID of the new menu. Your menu IDs should start with a company name or some other namespace prefix to ensure uniqueness. In particular, don't start your menu IDs with DW, which is the prefix used by the Dreamweaver menu IDs. One useful approach is to prefix every ID with your domain name (with the elements reversed); for example, if your domain name is joe.com, you could start every ID with com. joe. to ensure uniqueness.

platform Indicates that the menu should appear only on the given platform. Valid values are "win" and "mac".

Contents

None.

Note: Always use a </menu> tag to close a <menu> tag. Although the <menu> tag in the MXI file has no contents, it corresponds to the <menu> tag in the menus.xml file, which does have contents. Therefore, the <menu> tag is not defined as an empty tag, so you can't use the /> XML syntax to close the tag.

Container

This tag must be contained in a menu-insert tag.

```
<menu name = "Recent Frobs Converted" id = "JMMenu_Commands_RecentFrobs"
platform = "mac" >
</menu>
```

menuitem

Description

Describes the menu item to be inserted into the product's menu structure during installation of this extension.

Attributes

```
name, id, {key}, {platform}, {file}, {command}, {enabled}, {checked}, {dynamic},
{arguments}
```

name The menu item name that you want to appear in the menu. To set the menu item's access key in Windows, use an underscore (_) in front of the access letter. The underscore is automatically removed on the Macintosh. If two menu items have the same access key, the access key works only for the first of the two.

Note: To make an underscore character appear in a menu item, precede it with a percent sign—that is, use %_ instead of just an underscore.

The menu ID of the new item. Your menu IDs should start with a company name or some other namespace prefix to ensure uniqueness. In particular, don't start your menu IDs with DW, which is the prefix used by the Dreamweaver menu IDs. One useful approach is to prefix every ID with your domain name (with the elements reversed); for example, if your domain name is joe.com, you could start every ID with com. joe. to ensure uniqueness.

key The shortcut key for the menu item. For syntax details that apply to Dreamweaver, see "About customizing Dreamweaver menus" in the "Customizing Dreamweaver" chapter of *Using Dreamweaver*.

platform Indicates that the menu should appear only on the given platform. Valid values are "win" and "mac".

file The name of an HTML or JavaScript file that contains JavaScript code determining the behavior of the menu item. The path specified in the file attribute is relative to the Configuration folder. The file attribute overrides the command, enabled, and checked attributes. Either file or command must be specified for each menu item. Note that in some operating systems, filenames are case-sensitive; make sure to use the same capitalization in the file attribute as you use for the corresponding file and folder names on your hard disk.

command JavaScript code specifying the action to be taken when the user chooses the menu item.

enabled JavaScript code that the product executes before displaying the menu, to determine whether the menu item is enabled. The code should return a value of true or false, indicating that the menu item should be enabled or dimmed, respectively.

checked JavaScript code that the product executes before displaying the menu, to determine whether the menu item should have a check mark next to it. The code should return a value of true or false, indicating that the menu item should be checked or unchecked, respectively.

dynamic Indicates whether the menu item's text and state are to be determined dynamically, by an HTML file that contains JavaScript code (specified in the file attribute). Valid values are "true" and "false". If you don't specify the dynamic attribute, its default value is "false".

arguments Provides arguments to pass to the specified command file. This attribute is used only in conjunction with the file attribute.

Contents

None.

Container

This tag must be contained in a menu-insert tag that is not inside a server-format-definition-changes tag.

Example

```
<menuitem name = "Convert Frobs to Squigs" id = "JMMenu_Commands_ConvertFrobs"
key = "Cmd+Alt+Shift+F" platform = "mac" file = "commands/common/
    frob2squig.htm"
dynamic = "false" />
```

format

Description

Describes the data format to be inserted into the Dreamweaver Format menu during installation of this extension.

Attributes

This tag's attributes are difficult to write by hand. The best way to create a format tag is to use the interface inside Dreamweaver. After you create a format, open the appropriate Formats.xml file in a text editor and copy the appropriate format tag (generated by Dreamweaver). Paste this tag into the appropriate place in your extension installation file.

Then add an id attribute. Each format ID must be unique; your IDs should start with a company name or some other namespace prefix to ensure uniqueness. In particular, don't start your IDs with DW, which is the prefix used by the Dreamweaver IDs. One useful approach is to prefix every ID with your domain name (with the elements reversed); for example, if your domain name is joe.com, you could start every ID with com. joe. to ensure uniqueness.

Contents

None.

Container

This tag must be contained in a menu-insert tag that is inside a server-format-definition-changes tag.

```
<format
file = "Date/Time"
title = "Date/Time - 14:35"
expression = "<%\s*=\sDoDateTime\(.*, 4, 1033\)\s*%>"
strNamedFormat = "shortTime"
nLCID = 1033
id = "JMMenu_ServerFormatDef_ASP_2_DT18" />
```

separator

Description

Indicates that a separator should be inserted into a menu at the location specified by the containing menu-insert tag.

Attributes

```
id, {platform}
```

The ID for the separator; each separator ID must be unique. Your separator IDs should start with a company name or some other namespace prefix to ensure uniqueness. In particular, don't start your IDs with DW, which is the prefix used by the Dreamweaver menu IDs. One useful approach is to prefix every ID with your domain name (with the elements reversed); for example, if your domain name is joe.com, you could start every ID with com.joe. to ensure uniqueness.

platform Indicates that the separator should appear only on the given platform. Valid values are "win" and "mac".

Contents

None.

Container

This tag must be contained in a menu-insert tag.

Example

```
<separator id = "JMMenu_Commands_ConvertFrobs_Separator" platform = "win" />
```

comment

Description

Provides a comment about an item being inserted into the menu structure. The Extension Manager inserts this comment (in the form of an XML comment tag) into the menus.xml file as it installs the extension.

Attributes

None.

Contents

The text of a comment.

Container

This tag must be contained in a menu-insert tag.

Example

<comment>This command is part of the Mugwump extension.

shortcut-remove

Description

Indicates that the specified keyboard shortcut be removed from the menus.xml file.

Attributes

id

id ID of the shortcut or shortcut list to remove. A shortcut list is removed only if it's empty.

Contents

None.

Container

This tag must be contained in a configuration-changes tag.

Example

```
<shortcut-remove id = "DWMainWindow" />
```

shortcut-insert

Description

Indicates that a keyboard shortcut or shortcut list should be added to the menus.xml file.

Attributes

```
list_Id
```

list_Id The ID of the shortcut list into which the shortcut should be inserted. Use this attribute only when inserting a single shortcut into a list. Don't use it when inserting an entire list.

Contents

This tag must contain a shortcut tag or a shortcutlist tag.

Container

This tag must be contained in a configuration-changes tag.

```
<shortcut-insert list_Id = "DWMainWindow">
  <!-- shortcutlist or shortcut tag goes here -->
</shortcut-insert>
```

shortcutlist

Description

Specifies a shortcut list to be added to the menus.xml file.

Attributes

```
id, {platform}
```

ID for the new shortcut list. It should be the same as the menu ID for the menu bar that represents a window in Dreamweaver with which the shortcuts are associated. Currently supported IDs are DWMainWindow, DWMainSite, DWTimelineInspector, and DWHTMLInspector.

platform Indicates that the shortcut list should appear only on the given platform. Valid values are "win" and "mac".

Contents

None.

Container

This tag must be contained in a shortcut-insert tag.

Example

```
<shortcutlist id = "NewMenuBar" platform = "win" />
```

shortcut

Description

Specifies a keyboard shortcut to be added to the menus.xml file.

```
key, id, {command}, {file}, {platform}
```

key The key combination used to activate the keyboard shortcut. For syntax details that apply to Dreamweaver, see "About customizing Dreamweaver menus" in the "Customizing Dreamweaver" chapter of *Using Dreamweaver*.

id A unique identifier for a shortcut. Your shortcut IDs should start with a company name or some other namespace prefix to ensure uniqueness. One useful approach is to prefix every ID with your domain name (with the elements reversed); for example, if your domain name is joe.com, you could start every ID with com. joe. to ensure uniqueness.

command The JavaScript code to execute when the user issues the keyboard shortcut.

file A file containing the JavaScript code to execute when the user issues the keyboard shortcut. The file attribute overrides the command attribute; either file or command must be specified for each shortcut.

platform Specifies that the shortcut works only on the indicated platform. Valid values are "win" and "mac".

Contents

None.

Container

This tag must be contained in a shortcut-insert tag.

Example

```
 < shortcut \ key = "Shift+F5" \ command = "dw.newDocument()" \ id = "ShortCutTest" \ platform = "win" \ />
```

taglibrary-changes

Description:

Describes changes to be made to the TagLibraries.vtm file.

Attributes

None.

Contents

This tag may contain taglibrary-insert and taglibrary-remove tags.

Container

This tag must be contained in a configuration-changes tag.

taglibrary-insert

Description

Inserts the specified tag library at the end of file. Order is not important.

Attributes

None.

Contents

This tag may contain taglibrary tags that describe a tag library to be inserted. The Extension Manager verifies only that the XML structure is valid.

Container

This tag must be contained in a taglibrary-changes tag.

taglibrary-remove

Description

Removes the specified tag library.

Attributes

id

id ID of the tag library to be removed.

Contents:

None.

Container

This tag must be contained in a taglibrary-changes tag.

toolbar-changes

Description

Marks the beginning of toolbar changes.

```
{file}
```

file This optional attribute specifies the name of the toolbar file to edit. If not supplied, the default is Toolbars.xml.

Contents

This tag may contain the toolbar-insert, toolbar-item-insert, toolbar-remove, and toolbar-item-remove tags.

Container

This tag must be contained in the configuration-changes tag.

Example

This example illustrates the syntax and hierarchy of all tags that can be contained by the toolbar-changes tag.

toolbar-insert

Description

Inserts the specified toolbar at the end of file.

Attributes

None.

Contents

The toolbar tag, which describes the toolbar to be inserted. The Extension Manager verifies only that the XML structure is valid.

Container

This tag must be contained in the toolbar-changes tag.

Example

```
<toolbar-insert>
  <toolbar ...>
  </toolbar>
```

toolbar-remove

Description

Removes the specified toolbar.

Attributes

id

ID of the toolbar to be removed. id

Contents

None.

Container

This tag must be contained in the toolbar-changes tag.

```
<toolbar-remove id="toolbar_id" />
```

toolbar-item-insert

Description

Inserts the specified toolbar item at the specified location.

Attributes

```
insertBefore|insertAfter, appendTo|prependTo, toolbar
```

toolbar ID of the toolbar to append to if the insertBefore insertAfter item isn't found.

Contents

A tag that describes a toolbar item to be inserted. The Extension Manager verifies only that the XML structure is valid.

Container

This tag must be contained in the toolbar-changes tag.

Example

```
<toolbar-item-insert
  insertBefore|insertAfter|appendTo|prependTo="toolbar_or_item_id"
  toolbar="toolbar_id">
  <itemtype.../>
</toolbar-item-insert>
```

toolbar-item-remove

Description

Removes the specified toolbar item.

Attributes

id

id ID of the toolbar item to remove.

Contents

None.

Container

This tag must be contained in the toolbar-changes tag.

```
<toolbar-item-remove id="toolbar_item_id" />
```

extensions-changes

Description

Container tag that describes any changes to the Extensions.txt file, such as adding or removing extensions that you can open in Dreamweaver.

Attributes

None.

Contents

This tag may contain an extension-insert tag and an extension-remove tag.

Container

This tag must be contained in a configuration-changes tag.

Example

```
<extensions-changes>
  <!--extension-insert and extension-remove tags go here-->
</extensions-changes>
```

extension-insert

Description

Describes a new extension that Dreamweaver can open.

Attributes

```
extension, description

extension Specifies name of the extension, such as .gif or .htm.

description Describes what the extension is used for.
```

Contents

None.

Container

This tag must be contained in an extensions-changes tag.

```
<extension-insert extension="PHP" description="PHP files"/>
```

extension-remove

Description

Indicates an extension to remove from the Extensions.txt file.

Attributes

```
extension, {description} extension The name of the extension, such as .gif or .htm.
```

description This optional tag allows you to specify a description of the extension being removed. If no description is provided, the extension is removed from all lines of the Extensions.txt file.

Contents

None.

Container

This tag must be contained in an extensions-changes tag.

Example

```
<extension-remove extension="PHP" description="PHP files"/>
or
<extension-remove extension="PHP" />
```

source-format-changes

Description

Contains changes to the SourceFormat.txt file. Note that this tag is deprecated for Dreamweaver MX.

Attributes

None.

Contents

This tag may contain the following tags: element-insert, element-remove, attribute-insert, and attribute-remove.

Container

This tag must be contained in a configuration-changes tag.

```
<source-format-changes>
  <!--element-insert, element-remove, attribute-insert, and
    attribute-remove tags go here -->
</source-format-changes>
```

element-insert

Description

Describes elements added to the SourceFormat.txt file. This tag is deprecated for Dreamweaver MX.

Attributes

```
name, {break}, {indent}, {indentGroup}, {namecase}, {noformat}
```

name Indicates the name of the element to be inserted.

{break} Indicates whether there should be breaks before and after the opening and closing tags. The default setting of 1,0,0,1 specifies a break before but not after the opening tag, and a break after but not before the closing tag.

indent Indicates whether the text is indented from the left margin. The default value is "false".

indentGroup Indicates the group that the element conforms to in HTML Format preferences. Indention group 1 contains table rows and columns, and indention group 2 contains framesets and frames.

namecase Specifies that the capitalization you use in the tag overrides the capitalization specified in the user's HTML Format preferences. For example, an attribute onFoo would be written onFoo in the SourceFormat.txt file, not onfoo or ONFOO.

noformat Indicates that the line breaks, indention, and capitalization of an existing hand-coded instance of the new element you insert are never changed to those specified in SourceFormat.txt. The new format is only used when you create a new instance of the tag using the Dreamweaver tools. For example, if you hand-code <foo> and then insert the foo element <foo break="1,0,0,1" noformat> in SourceFormat.txt, each new <foo> tag inserted with the Dreamweaver tools will use the 1,0,0,1 line-break specification. The hand-coded instance of the <foo> tag in your document and any manual changes to it retain your original formatting. The default value is "false".

Contents

None.

Container

This tag must be contained in a source-format-changes tag.

```
<element-insert name = "div" break = "1,0,0,1" indent = "true" indentGroup =
   "2" namecase = "Div" noFormat = "false"/>
```

element-remove

Description

Describes elements removed from the SourceFormat.txt file. This tag is deprecated for Dreamweaver MX.

Attributes

name

name Describes the name of the element.

Contents

None.

Container

This tag must be contained in a source-format-changes tag.

Example

```
<element-remove name="div"/>
```

attribute-insert

Description

Describes attributes added to the SourceFormat.txt file. This tag is deprecated for Dreamweaver MX.

Attributes

```
name, {namecase}, {samecase}
```

name Describes the name of the attribute that is inserted from the SourceFormat.txt file.

namecase Specifies that the tag or attribute must always be capitalized as you have written in the tag regardless of user capitalization preferences in HTML Format preferences. For example, an attribute onFoo would be written onFoo in the SourceFormat.txt file, not onfoo or ONFOO.

samecase Specifies that the attribute's value should be capitalized the same way as the attribute, as specified in SourceFormat.txt. For example, if the attribute ALIGN is uppercase, then its associated value is uppercase as well—ALIGN="RIGHT", not ALIGN="right". The samecase attribute should be specified for any attribute that has no value, such as "nowrap" or "checked".

The samecase attribute only applies to attributes. The default value is "false".

Contents

None.

Container

This tag must be contained in a source-format-changes tag.

```
<attribute-insert name="onAbort" namecase="onAbort" samecase="true"/>
```

attribute-remove

Description

Describes attributes removed from the SourceFormat.txt file. This tag is deprecated for Dreamweaver MX.

Attributes

name

name Describes the name of the attribute that is removed from the SourceFormat.txt file.

Contents

None.

Container

This tag must be contained in a source-format-changes tag.

Example

```
<attribute-remove name="onAbort"/>
```

file-tokens

Description

Container tag that indicates any custom tokens.

Attributes

None.

Contents

One or more token tags for defining custom tokens.

Container

This tag must be contained in a macromedia-extension tag.

```
<file-tokens>
  <!-- token tags go here -->
</file-tokens>
```

Description

Defines a custom token for an extension.

Custom tokens let you specify the destination folder of one or more files from your extension during installation or provide a dialog box for the user to choose a destination folder for certain files. For example, you might use a custom token if your extension contains items that must be installed in a specific directory as well as a file, such as a tutorial, that can be installed anywhere on the hard disk. In this case, you could use a custom token tag to allow the user to select the destination folder for the tutorial while still installing the other files in the proper directories. If several files need to be grouped in the same directory, but that directory location is not important, you can allow the user to select the directory location.

Custom tokens are useful even if you don't allow the user to specify the destinations of files. You can easily change the destination directory of multiple files without having to manually change each destination path in the MXI file. In this case, you would use a custom token as you would use the \$Dreamweaver, \$Fireworks, \$Flash, \$fonts, or \$system token. For example, if your extension contains multiple files that must be installed in C:\program files\trailer, you can use a token tag to define a custom token called airstream; all of the files that use this token are installed in C:\program files\trailer. If you want to change the destination folder of the files using the \$airstream token, you have to make only one change in the token tag rather than change every instance of the path to the new destination in your MXI file.

Note: You cannot redefine the \$Dreamweaver, \$Fireworks, \$Flash, \$fonts, or \$system token with a custom token.

Attributes

```
name, {prompt}, {default}, {definition}
```

name The name of your custom token. This must be a unique name. Do not include the dollar sign (\$) in the name.

prompt Describes the kind of file to be installed in a folder. When you include this attribute, the user is prompted to specify a destination, and the value you provide is added to the dialog box's title. For example, if the attribute is prompt="Sample Files", the dialog box displays "Select Folder for Sample Files".

default Defines the default folder path if the prompt attribute is used. If you do not define the default attribute, the path box is blank. You can use a token in this attribute, such as default ="\$Dreamweaver".

definition Defines the file path of the token when you do not use the prompt attribute. This prevents the Select Folder dialog box from appearing, so that the user cannot choose a destination path. In the example below, all files using the token \$airstream are installed in C:\program files\trailer.:

```
\label{lem:condition} $$ \colon=C:\operatorname{C:program files}\trailer" /> $$
```

Note: If you use the prompt attribute, do not use the definition attribute.

Contents

None.

Container

This tag must be contained in a file-token tag.

Example

This example is for Windows platforms, which use backslashes (\) to delimit directories:

```
<token name="airstream" prompt="Sample File"
  default="$Dreamweaver\Configuration\Shared\trailer" />
```

This example is for the Macintosh, which uses colons (:) to delimit directories:

```
<token name="airstream" prompt="Sample File"
default="$Dreamweaver:Configuration:Shared:trailer" />
```

Extension types

The tables in this section list the valid extension types for each product:

- "Dreamweaver extension types" on page 43
- "Fireworks extension types" on page 45
- "Flash extension types" on page 46

Dreamweaver extension types

The following table lists the valid Dreamweaver extension types.

Extension type	Installation directory and location in UI	Version first supported in
Behavior	\$Dreamweaver\configuration\behaviors Behaviors panel	Dreamweaver 3
BrowserProfile	\$Dreamweaver\configuration\browserprofiles Target Browsers dialog box	Dreamweaver 3
CodeHint	\$Dreamweaver\configuration\codehints Document code view	Dreamweaver MX
CodeSnippet	\$Dreamweaver\configuration\snippet Snippets panel	Dreamweaver MX
ColoringScheme	\$Dreamweaver\configuration\codecoloring Document code view	Dreamweaver MX
Command	\$Dreamweaver\configuration\commands Commands menu	Dreamweaver 3
Connection	\$Dreamweaver\configuration\connections Databases panel	UltraDev 1
Datasource	\$Dreamweaver\configuration\datasources Bindings panel	UltraDev 1
Dictionary	\$Dreamweaver\configuration\content\dictionaries Text menu	Dreamweaver 3
Documenttype	\$Dreamweaver\configuration\documenttypes New Document dialog box	Dreamweaver MX
Encoding	\$Dreamweaver\configuration\encodings Page Properties dialog box	Dreamweaver 3
FlashButtonStyle	\$Dreamweaver\configuration\objects\media Insert menu	Dreamweaver 4
FlashElement	\$Dreamweaver\configuration\objects\flashelements Flash elements category of Insert bar	Dreamweaver MX 2004
Floater	\$Dreamweaver\configuration\floaters Window menu	Dreamweaver 3
HelpBook	\$Dreamweaver\help Help menu	Dreamweaver MX
JsExtension	\$Dreamweaver\configuration\jsextensions None.	Dreamweaver 3
KeyboardShortcut	\$Dreamweaver\configuration\menu\menu.xml Keyboard Shortcuts dialog box	Dreamweaver MX
Object	\$Dreamweaver\configuration\objects Insert menu and Insert bar	Dreamweaver 3

Extension type	Installation directory and location in UI	Version first supported in
Plugin	\$Dreamweaver\configuration\plugins None.	Dreamweaver 3
PropertyInspector	\$Dreamweaver\configuration\inspectors Property inspector	Dreamweaver 3
Query	\$Dreamweaver\configuration\queries None.	UltraDev 1

Tags and their compatible products

The following table lists each tag and its compatible Adobe products. An X in the application column indicates that the tag is compatible with that product. If there is no X in the column for that product, then the tag is not compatible with the application. If a tag is not supported by an application, but is included in the MXI file, it will be ignored during installation of the extension

Example MXI file

The following is an example of an MXI file that creates a Dreamweaver extension called Dog and Cat Extension Suite. This particular extension installs an object and a command, and modifies menu.xml and insertbar.xml to add menu items to the application's interface.

```
<macromedia-extension</pre>
  name="Dog and Cat Extension Suite"
  version="1.0.1"
  requires-restart="true"
  type="suite">
  <author name="Macromedia" />
  cnroducts>
    duct name="Dreamweaver" version="6" primary="true" />
  </products>
  <description>
    <![CDATA[This extension installs an object and a command while modifying
      menus.xml and insertbar.xml.]]>
  </description>
  <ui-access>
    <![CDATA[Access the Dog command by selecting Commands > Dog. Access the
      Cat object by selecting the Cat category within the Insert bar.]]>
  </ui-access>
  cense-agreement>
    <![CDATA[SAMPLE THIRD PARTY LICENSE TEXT:<br>
    Lorem ipsum dolor sit amet, consectetuer adipiscing elit, sed diam nonummy
    nibh euismod tincidunt ut laoreet dolore magna aliquam erat volutpat. Ut
    wisi enim ad minim veniam, quis nostrud exerci tation ullamcorper suscipit
    lobortis nisl ut aliquip ex ea commodo consequat.]]>
  </license-agreement>
  <files>
    <file source="cat.htm"
      destination="$dreamweaver/configuration/objects/cat" />
    <file source="cat.gif"
      destination="$dreamweaver/configuration/objects/cat" />
    <file source="dog.htm"
      destination="$dreamweaver/configuration/commands"/>
    <file source="dog.js"
      destination="$dreamweaver/configuration/commands" />
  <configuration-changes>
    <menu-insert insertAfter="DWMenu_Commands_SortTable"</pre>
      skipSeparator="true">
      <menu id="DWMenu_Commands_Dog" name="_Dog">
      </menu>
    </menu-insert>
    <menu-insert appendTo="Animals_Menu_Dog">
      <menuitem id="DWMenu_Commands_Dog_Dog1" name="_Insert Dog" />
      <menuitem id="DWMenu_Commands_Dog_Dog2" name="Insert _Dog Again" />
      <menuitem id="DWMenu_Commands_Dog_Dog3" name="Insert Dog _Again Again"</pre>
         file="commands dog.htm" />
    </menu-insert>
    <insertbar-changes>
      <insertbar-insert>
         <category folder="Cat" id="DW_Inserbar_Cat">
           <button file="cat/cat.htm" id="DW_Inserbar_Cat_Cat1" image="cat</pre>
             cat.gif" />
```
